LAB 7 BRAINSTORM
Partner's last name: Batson

This program will take input as a string and then prompt the user to enter different commands to manipulate the input string. The possible commands are print reverse, replace all, replace single, remove, and quit.

PROCESS:
1. Display short greeting and ask for input
2. Prompt for first command
3. Validate command input
4. Execute command & display updated string
   a. Repeat 4 until command is "quit"

- Each command will have at least 1 loop, with some possibly needing more (having to replace the 2nd or higher character will require a nested loop
- Need validation at all input instances
- Will probably need to have error checking in the replace commands if the character to replace doesn't exist
